
CPU SCHEDULING: CORE ALLOCATION FOR PROCESSES
FCFS (FIRST-COME FIRST-SERVED)
• Non-preemptive FIFO queue
• Convoy effect hurts throughput
• Zero scheduling logic overhead
imp! viva question
ties broken by
PRIORITY SCHEDULING
• Highest priority dispatched first
• Risk of indefinite blocking
• Solved by Aging (gradual priority boost)
degenerates to if q is large
equivalent to priority by 1/burst
SJF & SRTF
• Provably optimal average waiting time
• Starvation of long bursts
• Preemptive variant is SRTF
MLFQ (MULTI-LEVEL FEEDBACK)
runs RR in upper tiers
• Multiple queues with decreasing quantum
• CPU-bound jobs demote to lower tiers
• Periodic all-queue priority boost
ROUND ROBIN (RR)
• Fixed time quantum (q)
• Responsive for time-sharing
• Small q causes heavy context switch tax
degenerates to if q is large
